Secretary's foreword

Access to safe drinking water directly impacts on the health and wellbeing of a community, with water playing a key role in sanitation, hydration, food production and farming. Clean water enables communities to flourish and thrive. I am proud to share with you the annual report of regulatory activity in relation to drinking water during the 2024–25 financial year under the *Safe Drinking Water Act 2003*. This report outlines the work of water agencies across Victoria to ensure that drinking water supplies are safe and accessible for all communities. It also outlines the oversight and monitoring activities of the Health Regulator, using a risk-based approach to compliance under the relevant legislative framework and guidelines.

Of note, new *Safe Drinking Water Regulations 2025* came into effect in Victoria in July 2025. These were the culmination of extensive

consultation and reflect a contemporary public health approach to drinking water regulation. Building on the existing core framework, the new regulations support water agencies to continue to apply best practice principles as outlined in the Australian Drinking Water Guidelines, as well as improving risk management and regulatory intelligence approaches.

I look forward to seeing the operational benefits of the new regulations in coming years as we continue to ensure the provision of safe drinking water for all Victorians.

Jenny Atta PSM

Secretary

Department of Health

Acknowledgement of Aboriginal people living in Victoria

The department acknowledges the strength of Aboriginal and Torres Strait Islander peoples across the country and the power and resilience that is shared as members of the world's oldest living culture.

We acknowledge Aboriginal and Torres Strait Islander peoples as Australia's First People and recognise the richness and diversity of all Traditional Owners across Victoria.

We recognise that Aboriginal and Torres Strait Islander peoples in Victoria practice their lore, customs and languages, and nurture Country through their deep spiritual and cultural connections and practices to land and water.

We are committed to a future based on equality, truth and justice. We acknowledge that the entrenched systemic injustices that Aboriginal and Torres Strait Islander peoples endure, including in our health system, and that Victoria's ongoing treaty and truth-telling processes provide

an opportunity to right these wrongs and ensure Aboriginal and Torres Strait Islander peoples have the freedom and power to make the decisions that affect their communities.

We express our deepest gratitude and pay our deepest respect to ancestors, Elders, and leaders – past and present. They have paved the way, with strength and fortitude, for our future generations.

Through this annual report we are seeking to embed principles of self-determination and reconciliation, working towards self-determined outcomes and ensuring an equitable voice. As we work to achieve the vision of the annual report, we recognise the contribution of Aboriginal and Torres Strait Islander People to Victorian life and how it enriches us all.

From this point of the document onwards, 'Aboriginal' refers to both Aboriginal and Torres Strait Islander people.

Introduction

The *Safe Drinking Water Act 2003* (the Act) and the *Safe Drinking Water Regulations 2015* (the Regulations) provide Victorian water agencies and the Department of Health (the department) with a framework to ensure the supply of safe drinking water that supports the health and wellbeing of Victorian communities.

Section 32 of the Act requires the Secretary to give to the Minister a report in respect of each financial year that:

- a) provides a statewide perspective of drinking water quality; and
- b) provides details of the activities of the Secretary under this Act during the year and of the costs of those activities; and
- c) includes any other details that the Minister has asked the Secretary, by written notice, to include in the report.

This annual report provides a statewide perspective of drinking water quality and details the department's regulatory activities during the 2024–25 financial year.

Victoria's 20 water agencies are required, under s 26 of the Act, to submit an annual report to the Secretary on issues relating to the quality of drinking water and regulated water by 31 October each year. Water agencies' annual reports help inform the statewide perspective of drinking water quality.

In-depth information on the performance of each water agency can be found in their annual reports available on their websites. A summary of water agencies' performance is included in this annual report's 'Drinking water quality performance and regulatory requirements' section.

The Act requires this report to be provided to the Minister for Health no later than 28 February each year.

Water regulation in Victoria in 2024–25: a snapshot

478
water sampling
localities

Non complying water

11 notifications were made under s 18 of the Act regarding water that **did not meet a drinking water quality standard** under r 12 of the Regulations.

Customer complaints
10,136 drinking
water quality complaints

Known or suspected contamination

32 reports of known or suspected contamination were made under s 22 of the Act.

4 boil water advisories were issued.

11 reports due to *E. coli* detections.

Legislation

Safe Drinking Water Act

The *Safe Drinking Water Act 2003* (the Act) commenced on 1 July 2004.

The purpose of the Act is 'to make provision for the supply of safe drinking water'. The Act –

- a) requires water suppliers and water storage managers to prepare and implement plans to manage risks in relation to drinking water and some types of non-potable water
- b) provides for the auditing of those plans by approved auditors
- c) requires water suppliers to ensure that the drinking water they supply meets quality standards specified by the regulations
- d) requires water suppliers to disclose to the public information concerning the quality of drinking water
- e) provides for the variation, after community consultation, of water quality standards that relate only to aesthetic factors
- f) requires the reporting of known or suspected contamination of drinking water to the Secretary to the Department of Health
- g) empowers the Secretary to enforce this Act.

Safe Drinking Water Regulations 2015 sunset review

The *Safe Drinking Water Regulations 2015* (the Regulations), made under the Act, outline key requirements for the supply of safe drinking water in Victoria. The 2015 regulations, which were due to sunset on 7 July 2025, were remade on 24 June 2025 with a number of significant reforms; and the new regulations commenced on 6 July 2025.

The department conducted extensive engagement with Victoria's 20 water suppliers and water storage managers (collectively water agencies) to develop updated regulations, which sought to:

- support a data-driven, risk-based approach to regulation
- align risk management requirements with industry best practice
- establish more comprehensive, enforceable drinking water quality standards that reflect the latest scientific knowledge and research on what constitutes safe and aesthetically pleasing drinking water.

As part of the review, the department published a discussion paper in November 2024 to seek public feedback on the proposed reforms. This consultation provided an opportunity for the water sector and other interested parties to share their views and inform the development of a Regulatory Impact Statement (RIS) and draft regulations. The RIS and draft regulations were subsequently published in March 2025. A further period of public consultation followed, with written submissions received from water agencies, the industry peak body VicWater, industry experts, and members of the public.

The final regulations retain and build on the core requirements of the existing safe drinking water framework, supporting water agencies to continue applying best-practice risk management as outlined in the Australian Drinking Water Guidelines, while improving regulatory intelligence to enable more efficient, targeted, and risk-based regulation of drinking water in Victoria.

Administration of the Act

Functions of the Minister for Health

The Act provides several functions and powers to the Minister for Health, including the authority for:

- declaring non-drinking water to be regulated water
- approving water supplier variations to drinking water aesthetic standards
- exempting water suppliers from a drinking water quality standard
- imposing conditions relating to drinking water variations or exemptions
- determining a period for which an administration levy is payable by water agencies, apportioning the amount between the water agencies and ensuring payment into the Consolidated Fund
- ensuring an annual report on drinking water quality is provided to each House of the Parliament no later than the sixth sitting day after receiving the report.

Functions of the Secretary

The Secretary of the department is responsible for the general administration and enforcement of the Act. The functions of the Secretary under the Act include:

- protecting public health in relation to the supply of drinking water
- monitoring and enforcing compliance with the Act and the Regulations
- reporting on the performance of water agencies in relation to the requirements under the Act

- investigating and reporting on any aspect of drinking water quality in Victoria
- making recommendations to the Minister for Health on any matter relating to drinking water or regulated water
- promoting industry and public awareness and understanding of drinking water quality issues.

The Secretary also has the following specific authority under the Act:

- do all things necessary to carry out their functions, including requiring a water agency to give specified information
- accept an undertaking by a water agency relating to a contravention of the Act
- issue an enforcement notice to a water agency if it contravenes specific sections of the Act or breaches an undertaking
- establish and maintain a register of variations, exemptions and undertakings
- direct a water agency to provide specified information and take specified corrective action, if there is a risk to public health
- appoint authorised officers and permit them to assess and address immediate risks to public health relating to drinking water
- require water agencies to have their risk management plans audited and approve the auditor.

The Health Regulator

Effective regulation helps to ensure our communities stay safe and healthy. The Health Regulator is the main regulatory oversight branch of the Victorian Department of Health.

Established in 2024, we regulate a range of duty holders to ensure compliance with health legislation and prevent serious harm to the health of Victorians.

Our work includes developing education and guidance, issuing approvals and licences, monitoring compliance with regulatory requirements and taking risk-based, graduated and proportionate compliance and enforcement action.

These regulatory activities help to promote compliant behaviour, making sure health risks and impacts are managed, and Victorians are protected from harm. The Health Regulator regulates safe drinking water under the Act.

Water agencies

The Act requires water agencies to provide safe, good-quality drinking water. In 2024–25, the department regulated 20 water agencies, with the Act distinguishing between two types of water agencies: water storage manager and water supplier. The Act applies to all water agencies involved with the storage, treatment and distribution of drinking water and regulated water. This includes state-owned water corporations and other statutory authorities that supply drinking water to the public, including Parks Victoria and Alpine Resorts Victoria.

Water agencies, depending on whether they are a water storage manager or a water supplier, have a range of obligations under the Act, including:

- preparing, implementing and continuously reviewing a risk management plan in relation to drinking water, that is subject to audits
- ensuring the drinking water they supply meets drinking water quality standards specified by the Regulations
- notifying the Secretary of drinking water that does not comply with a water quality standard
- reporting any known or suspected contamination of drinking water to the Secretary
- providing an annual report related to the quality of drinking water and regulated water to the Secretary no later than 31 October each year.

Water storage managers

Water storage managers (Figure 1) store water and supply it to water suppliers.

There are four water storage managers. Melbourne Water supplies untreated and treated drinking water to water suppliers, while Goulburn-Murray Water, Southern Rural Water and Grampians Wimmera Mallee Water supply untreated water to water suppliers.

Grampians Wimmera Mallee Water operates as both a water storage manager and a water supplier.

Figure 1: Water storage managers

• Water storage manager head office location

* Grampians Wimmera Mallee Water is both a water supplier and water storage manager

Water suppliers

Most Victorians receive reticulated drinking water from a water supplier, that serves a specific geographic region (Figure 2). Within each region, all areas that are supplied with drinking water must be within a water sampling locality, as defined under the Regulations. A water sampling locality is an area where collected water samples are representative of the drinking water supplied to that specific area.

As of 1 October 2022, 17 water suppliers in Victoria are responsible for ensuring that their drinking water meets the drinking water quality standards. Among these, three metropolitan water suppliers receive treated drinking water from Melbourne Water (water storage manager) and apply additional treatment (secondary chlorination).

The remaining 14 water suppliers apply primary and secondary treatment to untreated water to ensure all customers receive safe drinking water.

Seven water suppliers also manage regulated water supplies (water that could be mistaken for drinking water, such as untreated reticulated water for non-drinking domestic uses). Specific provisions for managing the risks associated with these water supplies are included in the Act and the Regulations.

Figure 2: Water suppliers

- Water supplier head office location
- 1 Alpine Resorts Victoria: Falls Creek
- 2 Alpine Resorts Victoria: Lake Mountain
- 3 Alpine Resorts Victoria: Mt Baw Baw
- 4 Alpine Resorts Victoria: Mt Buller and Mt Stirling
- 5 Alpine Resorts Victoria: Mt Hotham
- 6 Parks Victoria (Tidal River)
- 7 Parks Victoria (Twelve Apostles)

Safe drinking water administration levy

In accordance with s 51 of the Act, water agencies pay a levy to assist in defraying the costs of administering the Act. The meaning of “costs of administering the Act” is detailed in s 52 of the Act. The proportion of levy that each water agency pays is based on a methodology that the Minister for Health considers fair and has been subject to consultation with stakeholders as required under s 53(d) of the Act.

For 2024–25 there was no change to the levy methodology. Key steps in its calculation were:

1. The department estimates its annual cost of administering the Act.
2. The rural water storage managers, Parks Victoria and Alpine Resorts Victoria are levied a flat rate of 0.15% of the department’s annual cost estimate.
3. The balance of the department’s annual cost estimate is apportioned to each of the state’s water suppliers proportional to their number of customer connections previously approved by the Minister.

4. The levy for the three metropolitan water suppliers is discounted by 25%, and this proportion is allocated to Melbourne Water, which supplies their treated drinking water.

The administration levy for the 2024–25 financial year was \$1,497,207 which was apportioned amongst the water agencies.

In 2023–24, the administration levy was \$1,475,769. The administration levy for 2024–25 is slightly higher due to the application of a cost indexation of 2.75% to the actual costs in 2023–24. 2.75% is in line with the DTF Cost Recovery Guidelines for 2024–25 and reflects the maximum annual rate to increase fees.

Table 1 shows the department’s costs in administering the Act in this reporting period, along with a comparison with the previous two financial years.

Table 1: Department expenditure to administer the Safe Drinking Water Act, 2022–23 to 2024–25

Expenditure type	2022–23	2023–24	2024–25	Variance to prior year
Salaries, allowances and salary-related on-costs	\$1,139,612	\$1,303,125	\$1,354,318	\$51,193
Indirect costs	\$157,974	\$80,420	\$44,800	-\$35,620
Operating costs	\$81,493	\$37,081	\$20,904	-\$16,177
Communication and education	\$2,080	\$0	\$0	\$0
Research and development	\$5,500	\$5,000	\$0	-\$5,000
Information technology	\$32,350	\$31,510	\$15,403	-\$16,107
Total expenditure	\$1,419,009	\$1,457,136	\$1,435,425	-\$21,711

Drinking water quality performance and regulatory requirements in 2024–25

Water sampling localities

Water suppliers are required to collect drinking water samples from water sampling localities that have been specified under r 6 of the Regulations. A water sampling locality is a discrete geographical area where water samples collected are representative of the drinking water supplied to that area.

All locations supplied with drinking water must be within a water sampling locality boundary. This allows water suppliers to determine any issues with drinking water sources, treatment processes or distribution systems, and to address any customer complaints.

As of 30 June 2025, there were 478 water sampling localities, an increase of one from the previous reporting period due to the inclusion of Elmhurst by Grampians Wimmera Mallee Water.

Drinking water quality standards

Section 17 of the Act requires water suppliers to ensure all drinking water supplied complies with quality standards. The drinking water quality standards are specified under r 12 of the Regulations, which states that drinking water supplied within a water sampling locality must not:

- exceed the standard set out in Schedule 2 of the Regulations (r 12(a))
- contain any algal toxin, pathogen, substance or chemical, whether alone or in combination with another toxin, pathogen, substance or chemical, in such amounts that may pose a risk to human health (r 12(b)).

Schedule 2 of the Regulations prescribes three drinking water sample parameters which must be analysed, the required frequency of analysis and the respective water quality standard that must be met (Table 2).

For parameters not specified in Schedule 2 of the Regulations, the Australian Drinking Water Guidelines is the authoritative reference for health-based guideline values and is used to determine compliance with r 12(b) of the Regulations.

Table 2: Safe Drinking Water Regulations Schedule 2 drinking water quality standards

Parameter	Sampling frequency	Quality standard
<i>E. coli</i>	Weekly	No <i>E. coli</i> per 100 mL, with the exception of any false-positive sample
Total trihalomethanes	Monthly	≤ 0.25 mg/L
Turbidity	Weekly	The 95th percentile of results for samples in any 12-month period must be ≤ 5.0 Nephelometric Turbidity Units

Notification of noncomplying water supplied

The Act requires a water supplier to notify the department if it becomes aware that the drinking water it is supplying does not comply, or is unlikely to comply, with a relevant drinking water quality standard. Section 18 of the Act requires this notification in writing and within 10 days of the water supplier becoming aware of the noncomplying water.

In 2024–25, six water suppliers submitted a total of 11 notifications on water that did not meet a standard under either r 12(a) (compliance with Schedule 2 drinking water quality standards) or r 12(b) (compliance with any other drinking water quality standards).

Of the 11 notifications in 2024–25, four related to noncompliance with r 12(a) and seven related to noncompliance with any other drinking water quality standards under r 12(b), as outlined in the sections below.

Appendix 1 lists all 18 notifications for the reporting period.

Regulation 12(a): compliance with Schedule 2 drinking water quality standards

To comply with r 12(a), drinking water samples must be analysed for the parameters under Schedule 2 drinking water quality standards of the Regulations, as shown in Table 2 above.

In this reporting period, four notifications were received from three water suppliers - Alpine Resorts Victoria, Grampians Wimmera Mallee Water and Lower Murray Water - relating to three water sampling localities that did not meet the *E. coli* or total trihalomethanes (THM) parameter of the Schedule 2 drinking water quality standards. This is a decrease from 19 notifications from three water suppliers representing seven water sampling localities in 2023–24.

The number of *E. coli* samples not meeting the drinking water quality standard remained unchanged from the previous reporting period. In contrast, there was a significant decrease in instances of noncompliance with the THM standard compared to the previous reporting period (Table 3).

Table 3: Water samples not meeting Schedule 2 drinking water quality standards, 2022–23 to 2024–25

Parameter	Water samples not meeting the quality standard		
	2022–23	2023–24	2024–25
<i>E. coli</i>	9	3	3
Total trihalomethanes	3	16	1
Turbidity	0	0	0
Total	12	19	4

Escherichia coli

Schedule 2 of the Regulations requires that all drinking water samples collected in each water sampling locality on a weekly basis are found to contain no *E. coli* per 100 mL, with the exception of any false-positive samples. The detection of *E. coli* can signal microbial contamination and therefore any detection must be immediately reported to the department under s 22 of the Act. More information on all *E. coli* detections can be found in the 'Reports of known or suspected contamination' section of this report.

When *E. coli* is detected in drinking water, an investigation is undertaken by the water supplier in accordance with the department's Guidelines for the investigation and reporting of *E. coli* detections. If the investigation concluded that the sample taken was representative of the drinking water supplied in the relevant water sampling locality, a notification must be made to the department under s 18 of the Act.

A total of three *E. coli* notifications were made in the 2024–25 reporting period. Two notifications were from Alpine Resorts Victoria at the Mount Buller Alpine Village – Low Level Reticulation water sampling locality and one from Lower Murray Water at the Nyah water sampling locality. The investigation into the *E. coli* detection in July 2024 by Alpine Resorts Victoria identified the likely cause to be from biofilm growth in the pipe and/or sample tap, which was located after the ultraviolet (UV) system and before the chlorination treatment step. As this sample point was assessed by Alpine Resorts Victoria to be not representative of the water supplied, it has since been relocated to ensure compliance with the Regulations. The other two investigations were inconclusive and did not identify a potential source of contamination.

Total trihalomethanes (THMs)

Total THMs are a group of disinfection by-products formed when chlorine reacts with a range of organic matter in water. Schedule 2 of the Regulations requires that all drinking water samples collected in each water sampling locality on a monthly basis are not to exceed the quality standard for Total Trihalomethanes of 0.25 mg/L.

Grampians Wimmera Mallee Water made one notification for exceeding total THMs, at the Quambatook water sampling locality. The exceedance was attributed to the Granular Activated Carbon (GAC) treatment step being offline for one month of maintenance due to a damaged nozzle.

All water suppliers in Victoria monitor for total THMs as required by the Regulations, including those that only use UV disinfection for primary treatment.

Turbidity

Turbidity is the cloudiness of water caused by the presence of fine, suspended matter. Schedule 2 of the Regulations require the 95th percentile of results for drinking water samples in any 12-month period to not exceed 5.0 Nephelometric Turbidity Units. During the year, there were no notifications made from water suppliers regarding this standard.

Performance summary of Schedule 2 parameters

During the reporting year, 475 out of 478 water sampling localities continuously met Schedule 2 drinking water quality standards.

Regulation 12(b): compliance with other drinking water quality standards

To manage compliance with r 12(b), and as part of their water sampling program, water suppliers use a risk-based approach to determine the water quality parameters, water sampling locations and frequency of testing in their risk management plans. Water suppliers and each water supply system face different risks, that can be influenced by factors such as the characteristics of the water supply catchment, treatments applied and supply system arrangements. Water suppliers’ water

sampling programs are commensurate with this risk and tailored to each water sampling locality and supply system.

Four water suppliers notified the department of a total of three parameters; trichloroacetic acid, lead and manganese, that did not meet a water quality standard under r 12(b) (compliance with any other drinking water quality standards).

As Table 4 shows, there was a total of seven notifications in 2024–25, an increase of two instances in water samples not meeting other drinking water quality standards compared with the previous reporting period.

Table 4: Water samples not meeting other drinking water quality standards, 2022–23 to 2024–25

Parameter	Water samples not meeting the quality standards		
	2022–23	2023–24	2024–25
Chlorine	1	1	0
Trichloroacetic acid*	3	3	5
Lead	1	0	1
Manganese	2	1	1
Total	7	5	7

* Disinfection by-products.

Disinfection by-products

Production of safe drinking water and maintaining microbial safety throughout the supply and reticulation system typically requires the addition of a residual disinfectant. Reactions of chlorine disinfectants with natural organic material in source waters can produce disinfection by-products. Although prolonged exposure to high concentrations of disinfection by-products may

increase risks to human health, short-term, low-level exceedances of the health guideline values do not present a risk to health.

While total THMs are included in the Schedule 2 standards, water suppliers also sample for other disinfection by-products where relevant. In 2024–25, Alpine Resorts Victoria made three notifications affecting the Mount Stirling – Telephone Box Junction water sampling locality

and one notification affecting Mount Baw Baw water sampling locality for trichloroacetic acid (TCA). During the reporting period, Goulburn Valley Water made one notification affecting the Dookie water sampling locality for TCA (Table 4 and Appendix 1).

Metals

Metals may be present in drinking water for several reasons, including:

- those resulting from contamination or naturally present in source waters that haven't been removed via treatment
- leaching from metal pipework and fittings
- their use in treatment processes (such as alum coagulant).

Barwon Water made one notification affecting the Lovely Banks Carrs Road water sampling locality for lead. Gippsland Water made one notification in which the Warragul water sampling locality did not meet the standard for manganese (Table 4 and Appendix 1).

Variations of aesthetic standards

Section 19 of the Act allows the Minister for Health to vary the aesthetic standards of drinking water on application by a water supplier. During the year there were no applications by water suppliers to vary aesthetic standards. There are no existing variations to aesthetic standards.

Exemption from water quality standards

Section 20 of the Act allows the Minister for Health to exempt a water supplier from the obligation to comply with a drinking water standard for a specified period, provided that adequate measures are proposed to eliminate or minimise any risks to public health.

During the year, there were no applications from water suppliers for exemption from meeting a drinking water quality standard under the Regulations. There were also no existing exemptions from meeting any water quality standard.

Reports of known or suspected contamination

Under s 22(1) of the Act, an officer of a water supplier, water storage manager or council is required to immediately report to the Secretary if they believe, or suspect on reasonable grounds, that water supplied, or to be supplied, for drinking purposes either:

- may be the cause of an illness
- may be the means by which an illness is being, has been or will be, transmitted

- may contain any pathogen, substance, chemical or blue-green algae toxin, whether alone or in combination, at levels that may pose a risk to human health, or
- may cause widespread public complaint.

In 2024–25, 32 reports were made under s 22 of the Act by 12 water agencies, compared with 39 reports in the previous year (Table 5), representing a decrease of approximately 18%.

Table 5: Number of reports made under section 22 of the Act, 2022–23 to 2024–25

Reporting period	Number of s. 22 reports
2024–25	32
2023–24	39
2022–23	68

Reported issues are broadly grouped into various categories in Figure 3, *E. coli* detections, widespread public complaints and the other category dominated the primary causes for s 22 reports for this reporting period.

Many of the reports were preventable, indicating that water agencies need to improve their proactive management of foreseeable risks to

their drinking water quality. Incident trends and some specific incidents are discussed in more detail in the ‘Emergency preparedness and incident management’ section of this report.

These reports are discussed in detail below. See Appendix 2 for all s 22 reports received in 2024–25.

Figure 3: Categories of reports made under section 22 of the Act, 2022–23 to 2024–25

Escherichia coli detections

During this reporting period there were 11 reports of *E. coli* detections compared with 14 in the previous year – a decrease of 21%. Of the 11 reports to the department, all water samples with *E. coli* detections were assessed for compliance with the *E. coli* drinking water quality standard. Eight samples were found to have met the criteria of false positive samples under Schedule 2 of the Regulations for the *E. coli* standard and three samples were found to be noncompliant with the standard. South Gippsland Water issued a boil water advisory for the *E. coli* detection at the Fish Creek water sampling locality due to some low chlorine residuals at customer taps and uncertainty regarding disinfection demand that may have indicated contamination of the drinking water supply.

Investigations by water suppliers into the *E. coli* detections attributed likely causes to sampling errors, sample tap contamination, contamination during sampling or transportation, or no definitive causes could be found.

Eight water agencies reported *E. coli* detections, with Alpine Resorts Victoria reporting detections on three occasions, North East Water reporting detections on two occasions, and Central Highlands Water, Grampians Wimmera Mallee Water, Lower Murray Water, South Gippsland Water, Wannon Water and Yarra Valley Water, each reporting detections on one occasion (Appendix 2).

Widespread public complaints

There were 13 reports of widespread public complaints in this reporting period by water suppliers compared with nine reports in the previous year, an increase of 44%.

Eight water agencies reported widespread public complaints, with North East Water reporting on four occasions, South East Water on three occasions, Central Highlands Water, Coliban Water, Gippsland Water, Grampians Wimmera Mallee Water, Greater Western Water and Yarra Valley Water, each reporting on one occasion (Appendix 2).

Widespread public complaints in the 2024–25 reporting period were due to loss of pressure and discolouration from the resuspension of sediments due to changes in water flow and from water main bursts, and taste and odour issues from compounds such as manganese, geosmin and 2-Methylisoborneol (MIB).

Other reports

There were eight 'Other' categories of reports during 2024–25. Six water agencies reported on "Other" incidents. Greater Western Water reported three incidents, Alpine Resorts Victoria, Coliban Water, South East Water, South Gippsland Water and Yarra Valley Water, each reported one incident.

Of these eight reports, three resulted in the issuing of boil water advisories by three water agencies; Coliban Water issued an advisory for the Guildford water sampling locality due to a loss of pressure from a mains break which had the potential for ingress into the system; South East Water issued an advisory for the Shoreham water sampling locality after a dead rodent was found in the clear water storage basin; and South

Gippsland Water issued an advisory for the Fish Creek water sampling locality due to a water main burst which had the potential for ingress into the system. The advisories remained in place while the water suppliers identified the cause of the issue, implemented corrective actions, and undertook verification monitoring to confirm that the water was safe to drink.

The 'Emergency preparedness and incident management' section of this report provides a summary on the drinking water advisories issued by water agencies during this reporting period.

The types of incidents reported in the remaining five "Other" reports included:

- Alpine Resorts Victoria:
 - a backup generator failed to start during a power outage at the Mount Buller Low Level Water Treatment Plant with the plant having no power for about 90 minutes
- Greater Western Water
 - a large burst water main caused low pressure in the Sunbury water sampling locality
 - the discovery of dead animals in a clear water storage basin servicing the Mount Macedon water sampling locality
 - a customer from the Diggers Rest water sampling locality complained about a chemical odour coming from their water on the day of the complaint and also from the street a week prior
- Yarra Valley Water
 - Secondary chlorinator overdose caused elevated chlorine in the network servicing the Monbulk Water Quality Zone (WQZ 47) water sampling locality.

Each water supplier undertook a rapid risk assessment of their respective reported incident to determine whether there was an immediate risk to public health and associated actions to protect public health. Following investigations, the water suppliers determined the cause of the incident, implemented corrective actions, and undertook verification monitoring to confirm that the water was safe to drink.

Drinking water quality complaints

Customer satisfaction can be a key indicator of water agency performance. As per the Regulations, water suppliers are required to provide a summary of drinking water quality complaints received in their annual reports. Customer complaints do not always correlate directly to human health risks, such as those relating to water quality aesthetics or taste and odour issues.

Yarra Valley Water undertook an internal investigation into their customer complaints reporting after data discrepancies were raised, due to a 10% decrease in customer complaints and an 8% increase in burst and leak events, which typically correspond to an increase in customer complaints received. Data entry errors were identified where water quality complaints related to known issues were not correctly recorded in their asset management system from January to May 2025 leading to an underreporting. Yarra Valley Water estimated an under report of 292 customer complaints and provided a detailed breakdown of the analysis in their 2024–25 Drinking Water Quality Report. Table 6 provides only reported customer complaints and does not include the estimated figure provided by Yarra Valley Water.

Table 6: Drinking water quality complaints by water suppliers, 2022–23 to 2024–25

		Number of complaints				Type of complaints		
		2022–23	2023–24	2024–25	Variance from 2023–24 to 2024–25 ^a	Discolour/ turbidity/ dirty water	Taste and odour	Other ^c
Metropolitan water suppliers								
1	Greater Western Water	1,242	1,786	2,257	↑26%	***	**	*
2	South East Water	2,388	2,362	3,326	↑41%	***	**	*
3	Yarra Valley Water	2,994	3,232	2,905^d	↓-10%	***	**	*
Regional water suppliers								
4	Barwon Water	209	267	217	↓-19%	**	***	*
5	Central Highlands Water	84	40	62	↑55%	***	**	*
6	Coliban Water	244	210	296	↑41%	***	**	*

14	Wannon Water	127	106	152	↑43%	***	**	*
15	Westernport Water	21	27	34	↑26%	***	**	*
16	Other water suppliers ^b	0	0	0	-	-	-	-
Total		8,334	9,057	10,136	↑12%	***	**	*

Notes

- a. Figures with a red upwards arrow denote an increase in customer complaints from 2023–24. Figures with a green downwards arrow denote a decrease in customer complaints from 2023–24.
- b. Parks Victoria and Alpine Resorts Victoria did not have any water quality complaints during the reporting year.
- c. The column relating to 'Other' complaints covers a broad range of enquiries such as, alleged illness, requests for data, white water, blue water, air in water, problems with aquatic animal pets and corrosion of internal household plumbing or appliances.
- d. Figure does not include the underreporting by Yarra Valley Water of 292 customer complaints.

*** Most common

** Second most common

* Least common

In 2024–25, 15 water suppliers received a total of 10,136 drinking water quality complaints.

Risk management plan audits

Under s 7 and s 8 of the Act, water agencies must prepare, implement, and continuously review and revise risk management plans. Section 11 of the Act enables the Secretary to require a water agency to have its risk management plan audited by an approved auditor during a specified period.

Approved auditors must assess risk management plans to determine whether a water supplier or water storage manager has complied with the obligations imposed by s 7 and/or s 8 of the Act during the audit period.

The risk management plan audits were completed during 2023 and covered the period from 1 January 2021 to 31 December 2022.

Compliance with s 7 and/or s 8 of the Act was detailed in the department's 2022–23 annual report on Victoria's drinking water quality. In summary, the auditors identified that nine water agencies were noncompliant with s 7 (1) of the Act during the audit period: Alpine Resorts Victoria (Mount Hotham Alpine Resort and Southern Alpine Resort - Lake Mountain & Mount Baw Baw); Barwon Water, Central Highlands Water, Coliban Water, East Gippsland Water, Gippsland Water, Greater Western Water and South East Water. Barwon Water and East Gippsland Water were found to be non-compliant for the second consecutive audit period.

The status of progress by water agencies in addressing risk management plan audit findings can be found in Table 7. While water agencies are not required to address opportunities for improvement (OFI), many do so as part of their commitment to continuous improvement. Further details on audit outcomes are available in each water agency's drinking water quality annual report, which are available on their respective websites.

A total of 30 major or minor noncompliances and 171 OFIs relating to risk identification and assessment were identified, underscoring the need for water agencies to continue strengthening their risk management assessments and practices.

All 30 noncompliances reported have been completed. Of the 171 OFIs identified, 22 remain open.

It should be noted that the alpine resort management boards were regarded as distinct water agencies to form Alpine Resorts Victoria after merging on 1 October 2022; therefore, individual audits were conducted for each Alpine Resort Management Board's risk management plan.

Table 7: Water agencies 2023 risk management plan audit outcomes

Water agency	Risk management plan audit outcome	No. of major and/or minor noncompliances	No. of OFIs	No. of completed findings (reported in water agency's annual reports)
Alpine Resorts Victoria; Falls Creek Alpine Resort	Complied with the obligations imposed by s 7(1) of the Act during the audit period	0	8	All completed
Alpine Resorts Victoria; Southern Alpine Resort – Lake Mountain & Mt Baw Baw	Did not comply with the obligations imposed by s 7(1) of the Act during the audit period	5 major noncompliances (Mt Baw Baw) and 4 minor noncompliances (Mt Baw Baw), 1 minor noncompliance (Lake Mountain)	23	All major and minor noncompliances completed, 16 OFIs completed
Alpine Resorts Victoria; Mt Buller and Mt Stirling Alpine Resort	Complied with the obligations imposed by s 7(1) of the Act during the audit period	0	9	7 OFIs completed
Alpine Resorts Victoria; Mt Hotham Alpine Resort	Did not comply with the obligations imposed by s 7(1) of the Act during the audit period	4 minor noncompliances	12	All minor noncompliances completed, 9 OFIs completed
Barwon Water	Did not comply with the obligations imposed by s 7(1) of the Act during the audit period	4 minor noncompliances	15	All completed
Central Highlands Water	Did not comply with the obligations imposed by s 7(1) of the Act during the audit period	1 minor noncompliance	5	All completed
Coliban Water	Did not comply with the obligations imposed by s 7(1) of the Act during the audit period	2 minor noncompliances	5	All completed
East Gippsland Water	Did not comply with the obligations imposed by s 7(1) of the Act during the audit period	1 minor noncompliance	4	All completed
Gippsland Water	Did not comply with the obligations imposed by s 7(1) of the Act during the audit period	2 minor noncompliances	5	All completed
Goulburn-Murray Water	Complied with the obligations imposed by s 8(1) of the Act during the audit period	0	1	0 OFIs completed
Goulburn Valley Water	Complied with the obligations imposed by s 7(1) of the Act during the audit period	0	0	N/A
Grampians Wimmera Mallee Water	Complied with the obligations imposed by s 7(1) and s 8(1) of the Act during the audit period	0	12	All completed

Water agency	Risk management plan audit outcome	No. of major and/or minor noncompliances	No. of OFIs	No. of completed findings (reported in water agency's annual reports)
Greater Western Water	Did not comply with the obligations imposed by s 7(1) of the Act during the audit period	4 minor noncompliances	11	All minor noncompliances completed 10 OFIs completed
Lower Murray Water	Complied with the obligations imposed by s 7(1) of the Act during the audit period.	0	18	11 OFIs completed
Melbourne Water	Complied with the obligations imposed by s 8(1) of the Act during the audit period.	0	4	All completed
North East Water	Complied with the obligations imposed by s 7(1) of the Act during the audit period.	0	7	All completed
Parks Victoria	Complied with the obligations imposed by s 7(1) of the Act during the audit period.	0	4	All completed
South East Water	Did not comply with the obligations imposed by s 7(1) of the Act during the audit period	1 major and 1 minor noncompliance	8	All completed
South Gippsland Water	Complied with the obligations imposed by s 7(1) of the Act during the audit period	0	5	All completed
Southern Rural Water	Complied with the obligations imposed by s 8(1) of the Act during the audit period	0	0	N/A
Wannon Water	Complied with the obligations imposed by s 7(1) of the Act during the audit period	0	2	All completed
Westernport Water	Complied with the obligations imposed by s 7(1) of the Act during the audit period	0	10	All completed
Yarra Valley Water	Complied with the obligations imposed by s 7(1) of the Act during the audit period	0	3	All completed

Regulated water declarations

Some water agencies supply untreated water directly to communities through a piped distribution system. This water is not intended for human consumption; instead, it is used for watering gardens, flushing toilets and other non-drinking domestic uses. If this water could be mistaken for drinking water, the Minister for Health may, under s 6 of the Act, declare the water to be regulated water.

Regulated water declarations are a means for managing these non-drinking water supplies within the safe drinking water regulatory framework. When a water agency supplies regulated water, it must have a risk management plan for that water supply. In addition, the water agency must take all reasonable steps to inform the community of the nature of the water and provide information about the health risks associated with drinking the water.

The process for determining whether a particular supply is declared as regulated water involves consultation between the water supplier and the affected community.

Regulated water declarations may also be made if drinking water supplies deteriorate to the point where drinking water quality standards cannot be met. This has occurred in circumstances where extreme weather events have significantly altered the characteristics of source water quality.

During this reporting period, the regulated water declaration for the town of Elmhurst, supplied by Grampians Wimmera Mallee Water, was revoked. Drinking water is now supplied to Elmhurst from the town's new water treatment plant, which treats water to drinking water standards. Appendix 3 lists the regulated water supplies for this reporting period.

Require certain information

Under s 29 of the Act, the Secretary may, by written notice, require a water agency to give any specified information to enable the Secretary to carry out their functions under the Act. The water agency must comply with a requirement within the time specified by the Secretary.

There was one written notice issued, under s 29 of the Act during the reporting period, to Barwon Water in September 2024, in regard to two s 22 reports for two cross connection incidents of Barwon Water's Class A recycled water main with the drinking water service line in Charlemont (October 2023) and Armstrong Creek (May 2024). Both affected properties were within the Pettavel water sampling locality.

The two s 22 reports were triggered by customer complaints to Barwon Water of discoloured water, and taste and odour, respectively coming from their drinking water taps. Both incidents occurred during dual pipe service connection audits being conducted by consultants and contractors.

Barwon Water investigated and committed to the delivery of three work streams to fully address connection risks going forward. These included property verification inspections to achieve further assurances (November 2023), stronger and adaptive end-to-end governance (April 2024), and robust developer works system that ensure connection compliance.

In October 2024, Barwon Water complied with the s 29 request and provided the required information. However, the department determined that Barwon Water had not implemented the requirements set out in its Risk Management Plan (RMP). Three preventative strategies in the RMP regarding risks of recycled water with drinking water were not implemented in accordance with

the RMP which pertained to Barwon Water's accreditation scheme for self-regulation of consultants and contractors for dual pipe networks from 2019 to 2024.

The department acknowledged Barwon Water's actions in updating its RMP with improved preventive strategies to address the noncompliance. Barwon Water committed to completing the Network Integrity Verification Testing Program to inspect all properties and verify records outlined in its s 29 response by the end of 2025. Barwon Water advised that the program's progress will be reported to the executive leadership team and to Barwon Water's Board, with regular updates to the department.

Further information will be provided in the department's 2025–26 annual report.

Undertakings

Under s 30 of the Act, the Secretary may accept undertakings from water agencies to address water quality issues and deliver permanent water quality improvements. An undertaking can be used when the department or the water agency identifies a contravention under the safe drinking water regulatory framework. The undertaking describes how the water agency will resolve the issue and how it will manage public health risks while addressing the contravention within a specified timeframe. During this reporting period, there were no undertakings in place.

Water agency annual reports

Under s 26 of the Act, all water agencies must provide an annual report on the quality of drinking water and regulated water for every financial year. These reports must be submitted to the Secretary by 31 October and then made available to the public on the respective water agency website by the next business day.

Emergency preparedness and incident management

Water agencies are responsible for ensuring drinking water meets all quality standards. As reported under the 'Drinking water quality performance' section, under s 22 of the Act, the water agency's officer is required to report known or suspected contamination. In instances where a drinking water supply is compromised, or a water agency is unable to confirm safety, an agency may issue an advisory to affected customers until corrective actions have been taken and verification confirms that the water is safe to drink.

Advisories issued by water agencies during 2024–25

During 2024–25, four section 22 reports resulted in four drinking water advisories being issued (Figure 4). These incidents related to burst water mains that increased the potential for contamination via ingress, a dead rodent found in treated clear water storage basin, and the detection of high *E. coli* concentration at a service basin. Many of these incidents were preventable and highlight the need for continuous improvements by water agencies.

In accordance with the requirements of their risk management plans, all water agencies must detail the procedures and protocols in place to monitor and manage risks to the water quality, as required under regulation r 8 (1) (c) (e) and (h), in the event of an incident or emergency. Water agencies should also regularly exercise their emergency management arrangements, apply any learnings from these exercises, and update plans, procedures and protocols in efforts to continuously improve.

Figure 4: Trend of section 22 reports and drinking water advisories, 2014–15 to 2024–25

The four drinking water advisory incidents outlined below resulted in water agencies issuing 'boil water' advisories. Further information on

each advisory is available in the respective water agency's Drinking Water Quality Annual Report, published on their website..

Table 8: Summary of advisories issued by water agencies in the 2024–25 reporting period

Water Agency	Water sampling locality	Date of incident and lifting of advisory	Type of advisory	Nature of incident
South Gippsland Water	Fish Creek	04 July 2024 – 08 July 2024	Boil water	A significant water main break caused a loss of pressure and the potential for ingress of contaminants into the water supply network. South Gippsland Water issued a boil water advisory to affected customers which was lifted a number of days later. During the advisory South Gippsland Water undertook an investigation, corrective actions and verification monitoring confirming that the water was safe to drink. Actions taken by South Gippsland Water included flushing of the water mains, providing a drinking water trailer in the town centre, field monitoring and taking of samples. The investigation found that the mains break was caused by an external fencing contractor who had not undertaken service proofing prior to commencing excavation works. South Gippsland Water identified and actioned improvements to its communications internally and externally.
South East Water	Shoreham	20 March 2025 – 22 March 2025	Boil water	Integrity breaches resulted in a dead rodent entering the Shoreham basin which was discovered during a routine inspection. Cattle grazing in a nearby paddock, reports of a rat issue, and the use of Warfarin to bait the rats further led to South East Water considering pathogen and chemical risks and issuing a boil water advisory to affected customers. The advisory was lifted after South East Water undertook an investigation, corrective actions and verification monitoring confirming that the water was safe to drink. Actions taken by South East Water included isolating the basin, providing customers with an alternative water supply such as bottled water and tankered water at key locations, flushing the network with water from a new source which had a higher chlorine residual, and taking samples. The basin remained offline until it had a structural assessment, was thoroughly inspected which found defects and further animals (three rats, one mouse and one lizard), the repair and maintenance works were completed, it was cleaned, filled and sampled. The basin was reinstated in July 2025. South East Water is continuing to implement its ROV-based inspections for Water Storage Assets Project as part of its Tank Inspection, Cleaning and Maintenance Program.

Water Agency	Water sampling locality	Date of incident and lifting of advisory	Type of advisory	Nature of incident
South Gippsland Water	Fish Creek	08 April 2025 – 10 April 2025	Boil water	A high concentration of <i>E. coli</i>, some low chlorine residuals at customer taps, uncertainty regarding disinfection demand that may have indicated contamination of the drinking water supply, and the detection site supplying the whole town, led to South Gippsland Water issuing a boil water advisory to affected customers. The advisory remained in place while South Gippsland Water undertook an investigation, corrective actions and verification monitoring confirming that the water was safe to drink. Actions taken by South Gippsland Water during the advisory included inspecting relevant assets, flushing of the distribution system, field monitoring and taking of samples. Although the root cause of the <i>E. coli</i> result was not found, South Gippsland Water made improvements to its sampling protocols.
Coliban Water	Guildford	03 May 2025 – 06 May 2025	Boil water	A burst water main on the core supply line to Guildford township caused zero pressure in the network, creating the potential for ingress of contaminants to enter the system. Coliban Water issued a boil water advisory to customers due to the risk of infiltration and provided bottled water and a water trailer in the Guildford area. Coliban Water repaired the burst main, flushed the network to remove possible contamination, conducted field monitoring and took two rounds of microbiological sampling on separate days and analysis to verify the safety of the drinking water.

Appendices

Appendix 1: Section 18 notifications for drinking water quality standards, 2024–25

No	Water agency	Water sampling locality	Water quality standard	Date
1	Alpine Resorts Victoria	Mount Buller Alpine Village – Low Level Reticulation	<i>E. coli</i> detection	Jul-24
2	Alpine Resorts Victoria	Mount Stirling – Telephone Box Junction	Trichloroacetic acid	Sep-24
3	Alpine Resorts Victoria	Mount Stirling – Telephone Box Junction	Trichloroacetic acid	Oct-24
4	Alpine Resorts Victoria	Mount Baw Baw	Trichloroacetic acid	Dec-24
5	Alpine Resorts Victoria	Mount Buller Alpine Village – Low Level Reticulation	<i>E. coli</i> detection	Jan-25
6	Alpine Resorts Victoria	Mount Stirling – Telephone Box Junction	Trichloroacetic acid	Feb-25
7	Barwon Water	Lovely Banks Carrs Road	Lead	Jan-25
8	Gippsland Water	Warragul	Manganese	Mar-25
9	Goulburn Valley Water	Dookie	Trichloroacetic acid	Sep-24
10	Grampians Wimmera Mallee Water	Quambatook	Total trihalomethanes	Dec-24
11	Lower Murray Water	Nyah	<i>E. coli</i> detection	Jan-25

Appendix 2: Section 22 reports, 2024–25

No.	Water agency	Water sampling locality	Reason	Date
1	Alpine Resorts Victoria	Mount Buller Alpine Village – Low Level Reticulation	<i>E. coli</i> detection	Jul-24
2	Alpine Resorts Victoria	Mount Buller Alpine Village – Low Level Reticulation	<i>E. coli</i> detection	Jan-25
3	Alpine Resorts Victoria	Mount Hotham	<i>E. coli</i> detection	Mar-25
4	Alpine Resorts Victoria	Mount Buller Alpine Village – Low Level Reticulation	Other – Power outage at water treatment plant	May-25
5	Central Highlands Water	Ballarat Central	<i>E. coli</i> detection	Mar-25
6	Central Highlands Water	Daylesford High Level, Daylesford Low Level-Hepburn	Widespread public complaint	Jun-25
7	Coliban Water	Epson-Huntly	Widespread public complaint	Feb-25
8	Coliban Water	Guildford	Other – Water main burst with potential for ingress *	May-25
9	Gippsland Water	Coongalla-Glenmaggie, Heyfield	Widespread public complaint	Feb-25
10	Grampians Wimmera Mallee Water	Horsham	Widespread public complaint	Mar-25
11	Grampians Wimmera Mallee Water	Minyip	<i>E. coli</i> detection	May-25
12	Greater Western Water	Sunbury	Other – Water main burst, low pressure event	Feb-25
13	Greater Western Water	Gisborne, Macedon, Mount Macedon and Riddells Creek	Widespread public complaint	Apr-25
14	Greater Western Water	Diggers Rest	Other – Elevated hydrocarbons	May-25
15	Greater Western Water	Mount Macedon	Other – Pathogen contamination (animals found in tank)	Jun-25

* 'Boil water' advisory issued

Appendix 2: Section 22 reports, 2024–25 (continued)

No.	Water agency	Water sampling locality	Reason	Date
16	Lower Murray Water	Nyah	<i>E. coli</i> detection	Jan-25
